

S3 Fig. Effect of seven drugs on binding specificity of HLA-B*57:01.

Three different peptides were tested for binding to HLA-B*57:01 in competitive binding assays as described previously [26,27]. Values are represented as geometric mean with 95% CI of one experimental run in quadruplicates, analyzed for statistical significance by paired one-tailed parametric t-test comparing log IC₅₀ values vs. vehicle; *p < 0.05 was significant only in the presence of acyclovir.
