Fig. S1. Schematic representation of FP assay and AFM analysis of preformed A β 42

seeds. (a) Schematic representation of FP assay. A mixture of unlabeled A β 42 monomers and 5-Carboxyfluorescein-labelled A β 42 peptide tracer molecules (^{FAM}A β 42) was incubated at 37 °C in a microtiter plate. This leads to the formation of fluorescently labelled fibrillar ^{FAM}A β 42/A β 42 co-aggregates that grow larger in their size with time. By quantification of fluorescent polarization (FP) the growth of ^{FAM}A β 42/A β 42 co-aggregates can be monitored in a time-dependent manner. For FAM molecules attached to small, rapidly rotating peptides (e.g., monomers) the initially photoselected orientational distribution becomes randomized prior to emission, resulting in low FP. Conversely, incorporation of FAM-conjugated tracer peptides into large, slowly rotating ^{FAM}A β 42/A β 42 co-aggregates results in high FP. Thus, FP measurement provides a direct readout for the time-dependent formation of large, fibrillar ^{FAM}A β 42/A β 42 co-aggregates in cell-free assays. **(b)** AFM analysis of preformed A β 42 seeds. Atomic force microscopy (AFM) analysis of preformed β -sheet-rich A β 42 fibrillar assemblies utilized as seeds to stimulate ^{FAM}A β 42/A β 42 co-aggregation in FP assays.

Fig. S2. Seed-mediated A β 42 aggregation. (a) Analysis of A β aggregates enriched by immunoprecipitation from brain extracts of transgenic APPPS1 mice by SDS-PAGE and immunoblotting using the 6E10 anti-amyloid antibody. **(b)** Analysis of 6E10-immunoprecipitated material from APPPS1 mouse brain extracts by Coomassie blue R staining of SDS gels **(c)** BN-PAGE and immunoblot analysis of seeded SCL-treated (10 μ M) and untreated ^{FAM}A β 42/A β 42 co-aggregation (0.1/ 10 μ M) reactions. Reactions were seeded with preformed β -sheet-rich fibrillar A β 42 aggregates (100 nM, monomer equivalent). **(d)** AFM examination of seeded (100 nM seeds, monomer equivalent)

^{FAM}Aβ42/Aβ42 co-aggregation (0.1/10 μM) reactions in the absence and presence of SCL (10 μM). Lower panels represent magnifications of selected areas.

Fig. S3. The anti-Aβ antibody 352 preferentially detects β-sheet-rich Aβ42 aggregates in dot blot assays. (a) ThT binding assay. Short time incubation of fibrillar Aβ42 aggregates (25 μM) and Aβ42 monomers (25 μM) with ThT (25 μM). ThT binding assays indicate that fibrillar Aβ42 aggregates but not monomers are β-sheet-rich structures. (b) Analysis of preformed fibrillar aggregates and monomers with dot blot assays. The monoclonal antibody 352 detects fibrillar ThT-reactive Aβ42 aggregates but not monomers. (c) AFM analysis confirms that fibrillar Aβ42 aggregates (10 μM, monomer equivalent) are recognised by the 352 antibody.

Fig. S4. SCL treatment prevents the formation of SDS-stable ^{FAM}Aβ42/ Aβ42 co-aggregates. (a) Analysis of SCL-treated (10 μM) and untreated ^{FAM}Aβ42/Aβ42 co-aggregation reactions by denaturing FRAs. Compound treatment prevents the time-dependent formation of SDS-unstable ^{FAM}Aβ42/Aβ42 co-aggregates. (b) Quantification of SDS-stable aggregates retained on filter membranes from a. Values are means ± SD, n = 3. Asterisks indicate significant differences as determined by the student t-test: * ≤ 0.05, ** ≤ 0.01, *** ≤ 0.001.

Fig. S5. SCL treatment decreases ThT binding to spontaneously formed Aβ42 aggregates. Aβ42 monomers (25 μM) were incubated with different concentrations of SCL (1, 10, 30 μM) for 15 h to obtain higher molecular weight aggregates. Then, ThT (25 μM) was added to reactions and fluorescence emission at 485 nm was measured. Values are means

\pm SD, n = 3. Asterisks indicate significant differences as determined by the student t-test: * \leq 0.05, ** \leq 0.01, *** \leq 0.001.

Fig. S6. SCL-treatment decreases the seeding activity of spontaneously formed A β 42 assemblies.

(a) Schematic representation of A β 42 seeding experiments with FP assays. First, A β 42 monomers (10 μ M) were incubated for 18 h in the presence and absence SCL (10 μ M) to produce preformed aggregates (pAgg and pAgg+SCL). Second, the generated structures were added to ^{FAM}A β 42/A β 42 co-aggregation assays to monitor their seeding activity. **(b)** Effects of preformed A β 42 seeds (250 nM, pAgg and pAgg+SCL) on spontaneous A β 42 aggregation (25 μ M) in ThT (25 μ M) dye-binding assays. In control experiments, equivalent SCL concentrations (250 nM) without preformed A β 42 aggregates were added to the ThT-based A β 42 aggregation reactions. Values are means \pm SD, n = 4 **(b)**.

Fig. S7. Inhibitory activity of SCL on spontaneous A β 42 aggregation monitored by NMR.

(a) 2D ¹H, ¹⁵N-HSCQ correlation spectrum of an A β 42 (50 μ M, ¹⁵N uniform label) aggregation reaction after 0 and 24 h at 300K. **(b)** ¹H, ¹⁵N-HSCQ correlation spectrum of an A β 42 (50 μ M, ¹⁵N uniform label) aggregation reaction with an equimolar concentration of SCL after 0 and 24 h at 300K.

Fig. S8. Investigating the interaction between A β 42 peptides and SCL with 1D NMR

WaterLOGSY experiments. **(a)** Reference 1H-1D spectrum of 500 μ M sclerotiorin (SCL) in buffer with DMSO. **(b)** WaterLOGSY spectrum of 500 μ M sclerotiorin in buffer with DMSO, all signals have the opposite (negative) sign compared to the H₂O signal, indicating that the compound is not aggregated in aqueous solution. **(c)** NMR WaterLOGSY spectrum

of 50 μM SCL in buffer with 50 μM A β 42. No SCL signals are detectable, while signals of A β 42 are visible, indicating that soluble A β 42 peptides are present in solution but SCL binding cannot be detected under these experimental conditions. **(d)** WaterLOGSY spectrum of 500 μM SCL in the presence of 50 μM A β 42 peptides. Signals for SCL are detectable, while signals for A β 42 peptides are vanished, indicating that the compound binds to A β 42 aggregates, which cannot be detected by solution WaterLOGSY NMR.

Fig. S9. SCL treatment decreases the formation of TAMRA-labeled fibrillar A β 42 aggregates in cell-free assays. Compound treated and untreated samples were analysed by AFM after 18h of incubation at 37°C. Lower row, magnifications from upper row.
