Supplemental Figure Legends

Figure S1 - Expression levels of bicluster genes across all transcriptomes.

Biclusters were identified by the program Samba based on data for significant differential expression (FDR<0.01, CuffDiff) for all pairwise comparisons. Gene expression levels were quantified as FPKM values using the software Cufflinks and for each bicluster, the distribution of expression levels is shown as violin plots across all ten samples. The order of samples was determined by the software Blind and the color codes indicates the rough grouping of samples into i) dauer larva (black), ii) early larvae (gray), and iii) adults and late larvae (white). All biclusters show highly significant differential expression (FDR<0.01, Wilcoxon test) in at least one comparison across the three developmental groupings. This supports the interpretation that all identified biclusters represent genes that are developmentally regulated.

Figure S2 – Comparison between RNA-seq and qRT-PCR.

We chose six candidate genes for qRT-PCR validation of expression values as obtained by RNA-seq. The left column shows the RNA-seq expression values (FPKM) in all ten transcriptomes, the right column shows the relative expression values as determined by qRT-PCR (mean and standard error for four biological replicates). The colour code indicates our previous grouping of transcriptomes into developmental stages (see Figure 1). With exception of the *P. pacificus* gene predictions Contig53-snapTAU.140, all genes showed very consistent expression values between both methods.

Supplemental Table Legends

Table S1 – Gene Ontology (GO) term enrichment

Overrepresentation of GO terms was done by borrowing annotations from *C. elegans*. For this purpose, *C. elegans* one-to-one orthologs of bicluster and housekeeping genes were tested for enrichment using the David functional annotation webtool using the total set of one-to-one orthologs as background. As some biclusters had only a few genes with one-to-one orthologs in *C. elegans*, only gene sets with at least 90 one-to-one orthologs were tested. Only GO terms with a fold enrichment greater or equal than 2 and an FDR corrected p-value below 0.01 are shown.

Table S2 – Comparisons with previous *P. pacificus* transcriptome profiles

Comparisons with previous *P. pacificus* transcriptome profiles were done to test for enrichment of biclustered genes in various experimental studies. The data used in this comparisons were differentially expressed gene lists from studies on dauer vs dauer exit worms, germline ablated worms and worms exposed to four different bacterial pathogens. P-values were computed using Fisher's exact test and FDR for multiple testing corrections. Only biclusters with enrichment value greater than 1 and p-value less than 0.01 are shown.

Table S3 – Protein domain enrichment in bicluster genes

P. pacificus gene predictions (version TAU) were annotated with PFAM domains using the HMMER 3.0 package. For each bicluster and also for housekeeping genes, overrepresentation of protein domains was tested using Fisher's exact test. Only enriched PFAM domains with FDR corrected p-value below 0.01 are shown.

Table S4 – Evaluation of orthology predictions for *C. elegans* genes with one-to-one orthologs

For 57 *C. elegans* genes, with one-to-one ortholog in *P. pacificus* (Supplementary Data 1), we tested whether the correct ortholog could be identified using our automated one-to-one orthology prediction pipeline. The correct ortholog could indeed be identified in 42 cases, failure in orthology assignment could in almost all cases be attributed to gene prediction errors (gene fusions, split predictions and missing predictions).

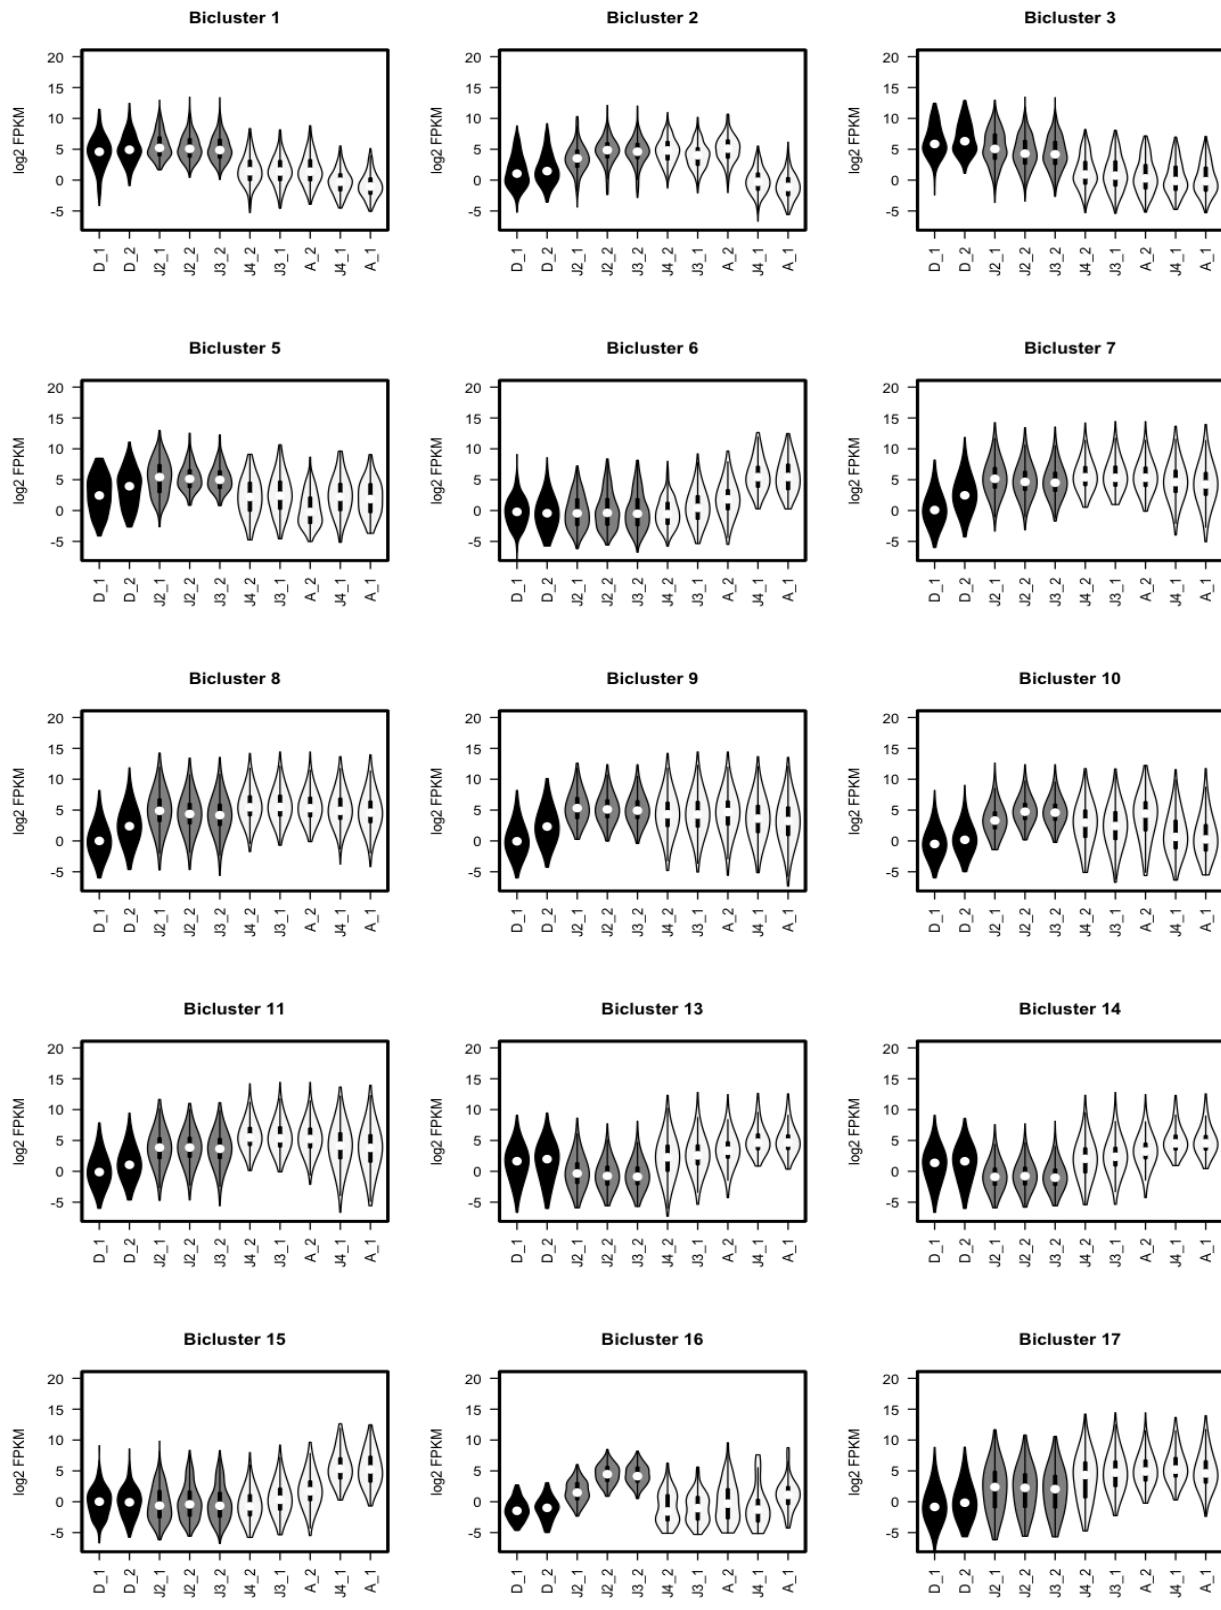

Table S5 - Evaluation of ortholog predictions for *C. elegans* genes without one-to-one orthologs

We used a data set of 50 genes, for which manual analysis could not identify *P. pacificus* orthologs, to test for false positive orthology predictions. In 48 out of 50 cases, no ortholog was predicted indicating a high reliability of our predictions.

Supplemental Data Legends**Supplementary Data S1 – Protein sequences for manually curated one-to-one orthologs**

To assess the performance of our one-to-one orthology prediction pipeline, we compiled a set of 57 *C. elegans* genes with known *P. pacificus* one-to-one orthologs. The *P. pacificus* orthologs were identified by repeated rounds of multiple alignment with putative paralogs, maximum likelihood tree reconstruction, and manual curation (detection of split and fused gene predictions, completion using TBLASTN). These manually curated *P. pacificus* sequences were used for phylogenetic analysis only. Please note, that in most cases, they represent incomplete sequences as no experimental validation was carried out.
