

**Supplemental figure 1: UV spectrum of the UV lamps.** Model: Exo Terra Reptile UVB. The illustration was provided by the manufacturer and has been slightly modified.

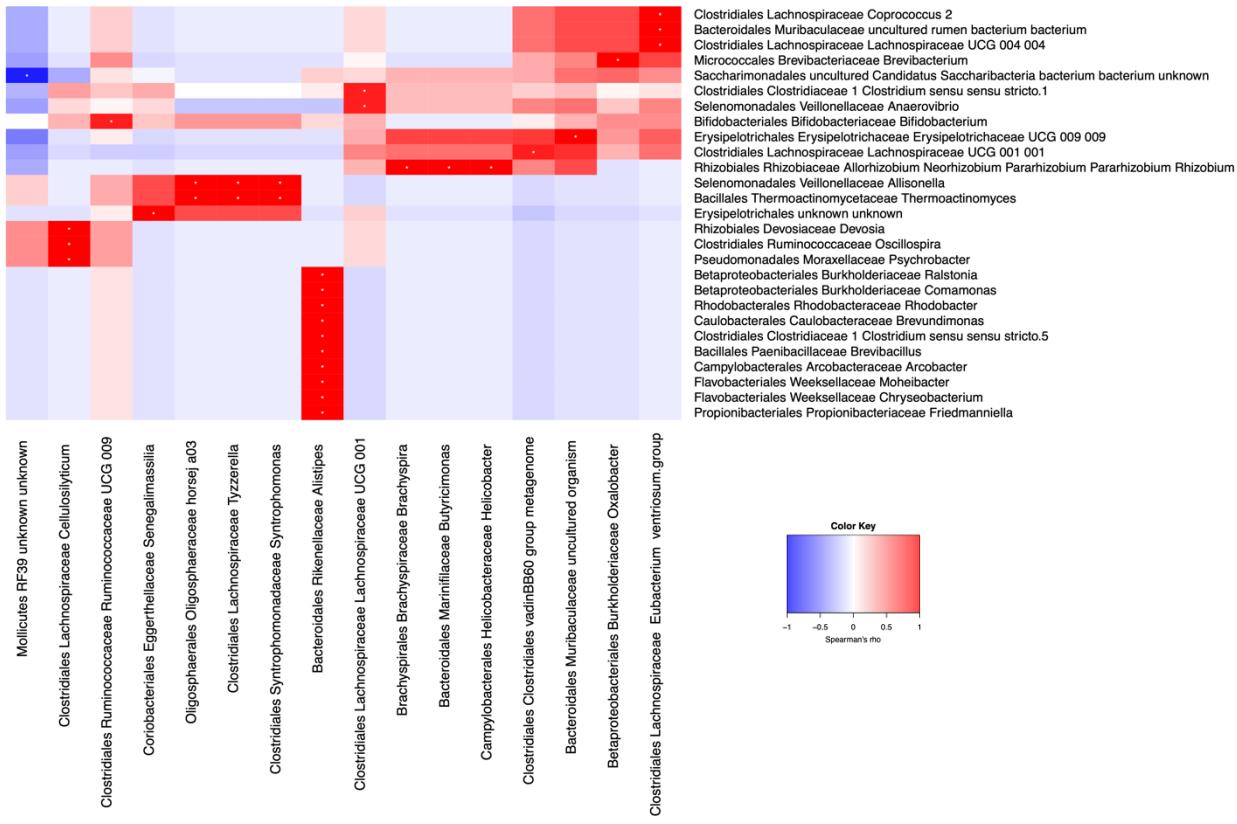

**Supplemental figure 2: Intersection between daily UV exposure and dietary vitamin D supply on the basis of plasma 25-hydroxyvitamin D<sub>3</sub> (25(OH)D<sub>3</sub>) concentrations in pigs of the pre-study.**

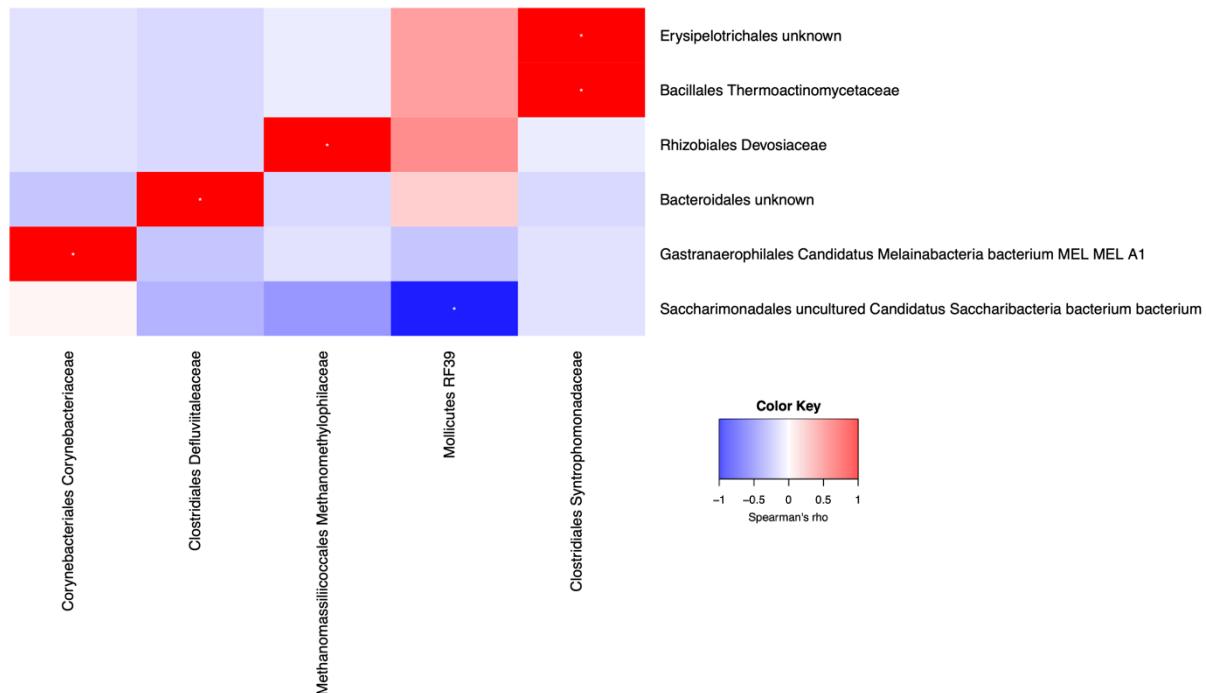

Pigs exposed to UV light did not receive oral vitamin D. Data are reported as mean values ± standard deviation (averaged over week 1 to 4 from 3 to 4 animals per group). The dotted line represents the mean plasma 25(OH)D<sub>3</sub> concentration of pigs with a dietary vitamin D supply of 20 µg/d.

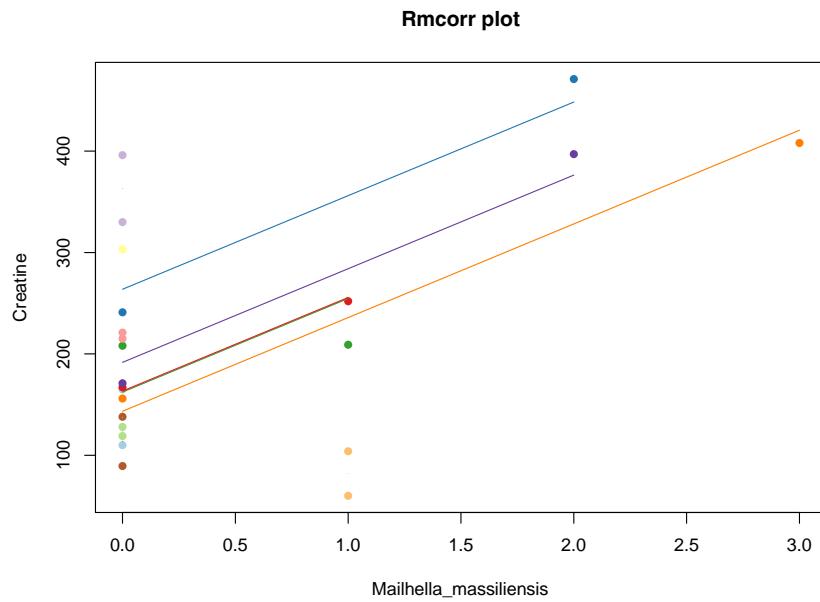

**Supplemental figure 3: Heatmap of stool and chyme microbiome correlation at the species level.** The x-axis represents stool microbes, and the y-axis represents chyme microbes. Spearman's correlation tests were executed, and the results underwent adjustment for multiple testing using the Benjamini-Hochberg correction. White asterisks denote instances where Spearman's correlation yielded a q-value of less than 0.05, indicating statistical significance.

**Supplemental figure 4: Heatmap of stool and chyme microbiome correlation at the genus level.** The x-axis represents stool microbes, and the y-axis represents chyme microbes. Spearman's correlation tests were executed, and the results underwent adjustment for multiple testing using the Benjamini-Hochberg correction. White asterisks denote instances where Spearman's correlation yielded a q-value of less than 0.05, indicating statistical significance.

**Supplemental figure 5: Heatmap of stool and chyme microbiome correlation at the family level.** The x-axis represents stool microbes, and the y-axis represents chyme microbes. Spearman's correlation tests were executed, and the results underwent adjustment for multiple testing using the Benjamini-Hochberg correction. White asterisks denote instances where Spearman's correlation yielded a q-value of less than 0.05, indicating statistical significance.

**Supplemental figure 6: Correlation of the plasma creatine level and the stool abundance of *Maihella massiliensis*.** The repeated measures correlation analysis was conducted utilizing the Rmcrr package, with subsequent adjustments for multiple testing employing the Benjamini-Hochberg correction. The calculated correlation coefficient was 0.93, while the associated q-value was 0.03. In the scatter plot, subjects are distinguished by distinct colors, and parallel lines have been fitted to the data points representing each subject.

**Supplemental table 1: Composition (% of total) of pig feeds.**

	Pre-Starter feed	Starter feed
Wheat	38.0	38.0
Barley	17.7	20.6
Corn	8.0	12.0
Soybean meal	22.0	18.0
Wheat bran	3.0	3.0
Whey powder	5.0	2.5
Soybean oil	2.5	2.4
Vitamin D-free premix of vitamins and minerals*	2.0	2.0
Monocalcium phosphate	0.5	0.5
L-lysine HCl	0.56	0.56
DL-methionine	0.22	0.22
L-threonine	0.26	0.26
L-valine	0.17	0.17
L-tryptophan	0.06	0.06

\* Basu Mineralfutter GmbH, Bad Sulza, Germany

**Supplemental table 2: Plasma concentrations of folic acid metabolites in pigs at baseline (week 0), after two and four weeks of intervention.**

	Dietary vitamin D		UV exposure		P values		
	Median	IQR	Median	IQR	Group	Time	Group x time
