

Supplemental Material

Table S1. Definition of CVD and CVD risk factors

Cardiovascular disease or risk factor	Definition/measurements
Prevalent diseases	Self-reported medical history of myocardial infarction (MI), angina pectoris, heart failure, arrhythmias, intermittent claudication, hypertension, diabetes mellitus, hyperlipidemia and stroke, all assessed through questionnaires (yes/no).
Smoking status and alcohol consumption	Categorized as current, former or never-smokers/consumers. Current alcohol consumption was further classified as risky if the Alcohol Use Disorders Identification Test (AUDIT-C) scored >4 in men or >3 in women, otherwise as non-risky
Antihypertensive medication intake	Assessed according to the Anatomical Therapeutic Chemical classification codes: C02, C03, C07, C08 and C09
Family history of MI	Self-reported family history of MI (maternal or paternal) diagnosed before the age of 60 years
Systolic (SBP)- and diastolic-blood pressure (DBP) (mmHg)	Measured twice in the sitting position after 5 min of rest and recorded at 2 min intervals using an Omron-Hem-705IT device, and the second values were used
Body mass index (BMI)	Calculated as body weight divided by the square of body height (kg/m ²) and categorized as underweight (<18.5 kg/m ²), normal weight (18.5-24.9 kg/m ²), overweight (25.0-29.9 kg/m ²) and obesity (≥30 kg/m ²), respectively. In n=4,627 (2.2%) study participants, weight and height were not measured. In these individuals BMI was calculated from self-reported weight and height.
Employment status	Categorized as employed, unemployed or economically inactive (i.e., pensioners).
Migration status	Defined as previously reported (yes/no). Migration status was recorded based on participants' nationality and country of birth and their parents' nationality and country of birth (reference provided in the manuscript).
Ethnicity	Categorized based on self-reported geographical regions of origin and phenotypic characteristics of the study participant.
Height (cm), weight (kg), waist circumference (WC) and body fat (%)	Measured with SECA (Stadiometer 274, mBCA 515, circumference measuring tape-201), Hamburg, Germany
Triglyceride, total-, low-density lipoprotein (LDL)- and high-density lipoprotein (HDL)-cholesterol concentrations (mmol/l) ^a	Measured photometrically in serum using either the Dimension Vista 1500 (Siemens Healthineers, Erlangen, Germany), the Advia 2400 (Siemens Healthineers, Erlangen, Germany), the Cobas 8000/8100/6000/701 systems (Roche Diagnostics, Rotkreuz, Schweiz), the AU680/5800/5822 systems (Beckman Coulter, Brea, USA) or the DxC 800 (Beckman Coulter, Brea, USA)
Glycated hemoglobin (HbA1c) concentrations (mmol/mol) ^a	Measured in EDTA-blood by high-performance liquid chromatography, immunoturbidimetry, immunoassay or capillary electrophoresis using either the Tosoh G8/G11 (Tosoh Bioscience, Inc., San Francisco, USA), the Variant™ II (Bio-Rad Laboratories, Hercules, USA), the DxC 800 (Beckman Coulter, Brea, USA), the Cobas c502/8000 systems (Roche Diagnostics, Rotkreuz, Schweiz), the Capillars (Sebia, Lisses, Frankreich), the D-100 (Bio-Rad Laboratories, Hercules, USA), or the Dimension Vista (Siemens Healthineers, Erlangen, Germany),
High-sensitivity C-reactive protein (hs-CRP) concentrations (mg/l) ^a	Measured in serum by nephelometry or immunoturbidimetry using either the Dimension Vista 1500 (Siemens Healthineers, Erlangen, Germany) or the Cobas 8000 (Roche Diagnostics, Rotkreuz, Schweiz).

^a Laboratory analyses were performed in decentral cooperating institutions close to the respective study centers. During the course of the baseline examination twelve of the eighteen study centers opted for central laboratory analyses at the Institute of Clinical Chemistry and Laboratory Medicine of the University Medicine Greifswald. Six study centers performed the analysis in external laboratories over the whole baseline period.

Table S2. Numbers and percentages of missing data in the NAKO study participants

	n (%) missing in All	n missing in Women	n missing in Men
Missing < 1%			
Sex ^a	0	-	-
Age ^a	0	-	-
Employment status ^a	1,644 (0.8)	821	823
Immigration background ^a	182 (0.08)	15	92
Myocardial infarction ^a	549 (0.3)	219	330
Angina pectoris ^a	1,123 (0.5)	442	681
Heart failure ^a	1,464 (0.7)	627	837
Arrhythmias ^a	1,574 (0.8)	760	814
Intermittent claudication ^a	1,112 (0.5)	550	562
Hypertension ^a	923 (0.4)	365	558
Diabetes mellitus ^a	591 (0.3)	265	326
Hyperlipidemia ^a	2,123 (1.0)	863	1,260
Stroke ^a	701 (0.3)	341	360
Systolic blood pressure (SBP) ^a	483 (0.2)	296	187
Diastolic blood pressure (DBP) ^a	483 (0.2)	296	187
SBP/DBP \geq 140/90 mmHg ^a	482 (0.2)	295	187
Body mass index ^a	1,014 (0.5)	532	482
BMI categories ^a	1,014 (0.5)	532	482
Missing 1% to <5%			
Waist circumference ^a	9,925 (4.8)	5,269	4,656
Smoking status ^a	8,894 (4.3)	4,723	4,171
Alcohol consumption ^a	9,691 (4.7)	5,147	4,544
Antihypertensive therapy ^a	3,139 (1.5)	1,534	1,605
Beta-blockers ^a	3,139 (1.5)	1,534	1,605
Total cholesterol ^a	8,801 (4.3)	5,045	3,756
HDL-cholesterol ^a	9,561 (4.7)	5,455	4,106
Glycated hemoglobin (HbA1c) ^a	9,614 (4.7)	5,495	4,119
Missing 5% to <10%			
Educational attainment ^a	14,436 (7.0)	7,440	6,996
Monthly net equivalent income ^a	13,951 (6.8)	8,089	5,862
Relative income ^a	13,951 (6.8)	8,089	5,862
Ethnicity/Country of origin	20,150 (9.8)	11,053	9,097
Body fat percentage ^a	13,915 (6.8)	7,429	6,486
LDL-cholesterol	19,986 (9.8)	10,749	9,237
Missing \geq 10%			
Triglycerides	32,014 (15.6)	16,881	15,133
High-sensitivity C-reactive protein (hs-CRP)	82,312 (40.2)	42,446	39,866
Family history of MI ^a	33,029 (16.1)	17,510	15,519

LDL-cholesterol missing in one study center. Triglycerides missing in two study centers. Hs-CRP missing in 5 study centers.

^aVariables included in MICE. Auxiliary variables considered: self-reported multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus, psoriasis and depression (missing <1% in each).

Table S3. Associations between educational attainment and CVD or CVD risk factors in the NAKO study-baseline assessment in women and men (n=200,279, 50.5% women, 49.5% men)*. Presented are age-adjusted odds ratios (OR) and women to men ratio of OR (ROR) with 95% CI for low and middle education (reference=high education) from logistic or multinomial regression models

Cardiovascular risk factor/CVD	Women n=101,071			Men n=99,208			Women to Men ROR (95% CI)	
	Low education OR (95% CI)	Middle education OR (95% CI)	High education OR (95% CI)	Low education OR (95% CI)	Middle education OR (95% CI)	High education OR (95% CI)	Low education ROR (95% CI)	Middle education ROR (95% CI)

*In the population reported as Caucasians. CVD, Cardiovascular Disease; PCE, Pooled Cohort Equation.

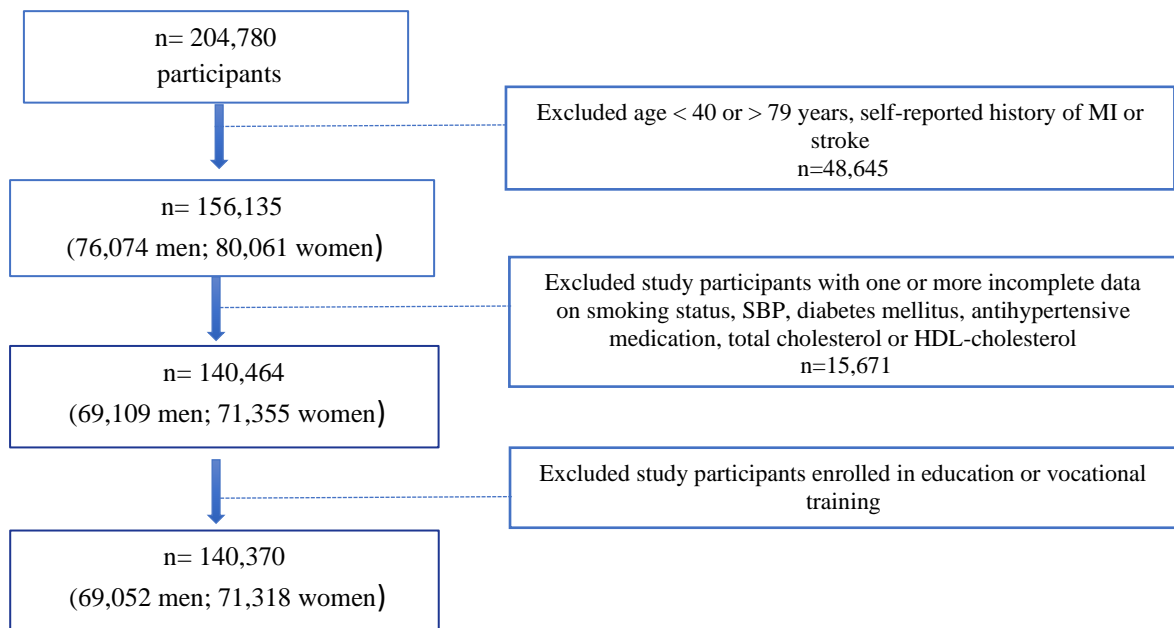

PCE based on the population aged 40-79 years, Reynolds Score algorithm based on the population over 45 years old.

Figure S1: Flowchart illustrating the inclusion criteria for the SCORE2 algorithm risk score calculation

MI, myocardial infarction

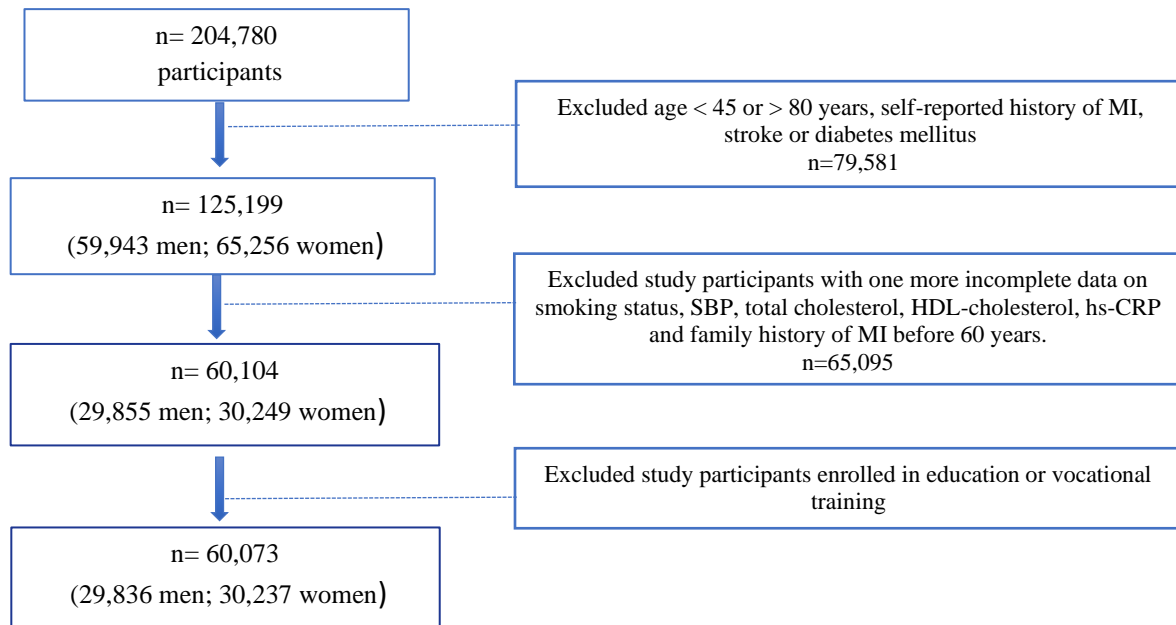

Figure S2. Flowchart illustrating the inclusion criteria for the Pooled cohort equation (PCE) algorithm risk score calculation*

MI, myocardial infarction; SBP, systolic blood pressure.

*The PCE estimates the 10-year risk of atherosclerotic CVD (non-fatal MI or coronary heart disease (CHD) death, fatal or nonfatal stroke) in the CVD free population in both sexes. The PCE which can be used in individuals 40 to 79 years old, incorporates ethnicity (non-Hispanic African Americans and non-Hispanic whites) in addition to the traditional cardiovascular risk factors: sex, age, SBP (mmHg), antihypertensive treatment (yes/no), total cholesterol (mg/dl), HDL-cholesterol (mg/dl), diabetes mellitus (yes/no) and current smoking (yes/no). Values using the international system of units (SI) mmol/l were converted to the unit system required in the algorithm (mg/dl).

Figure S3. Flowchart illustrating the inclusion criteria for the Reynolds Risk Score algorithm*

MI, myocardial infarction; SBP, systolic blood pressure; hs-CRP, high sensitive C-reactive protein.

The Reynolds Risk Score estimates the 10-year CVD risk (MI, ischemic stroke, coronary revascularization and cardiovascular death) in women and men. Factors in the risk prediction model included age (years), smoking (currents vs. other), SBP (mmHg), total cholesterol (mg/dl), HDL-cholesterol (mg/dl), hs-CRP (mg/l) and family history (parental) of premature MI (yes/no). Values using the international system of units (SI) mmol/l were converted to the unit system required in the algorithm (mg/dl).

Figure S4. Associations between relative income and CVD or CVD risk factors in the NAKO study-baseline assessment in women and men (n=200,279, 50.5% women, 49.5% men)*. Presented are age-adjusted odds ratios (OR) with 95% CI for relative income <60%, 60%-79%, 80%-99% and 100%-149% (reference=high relative income) from logistic or multinomial regression models

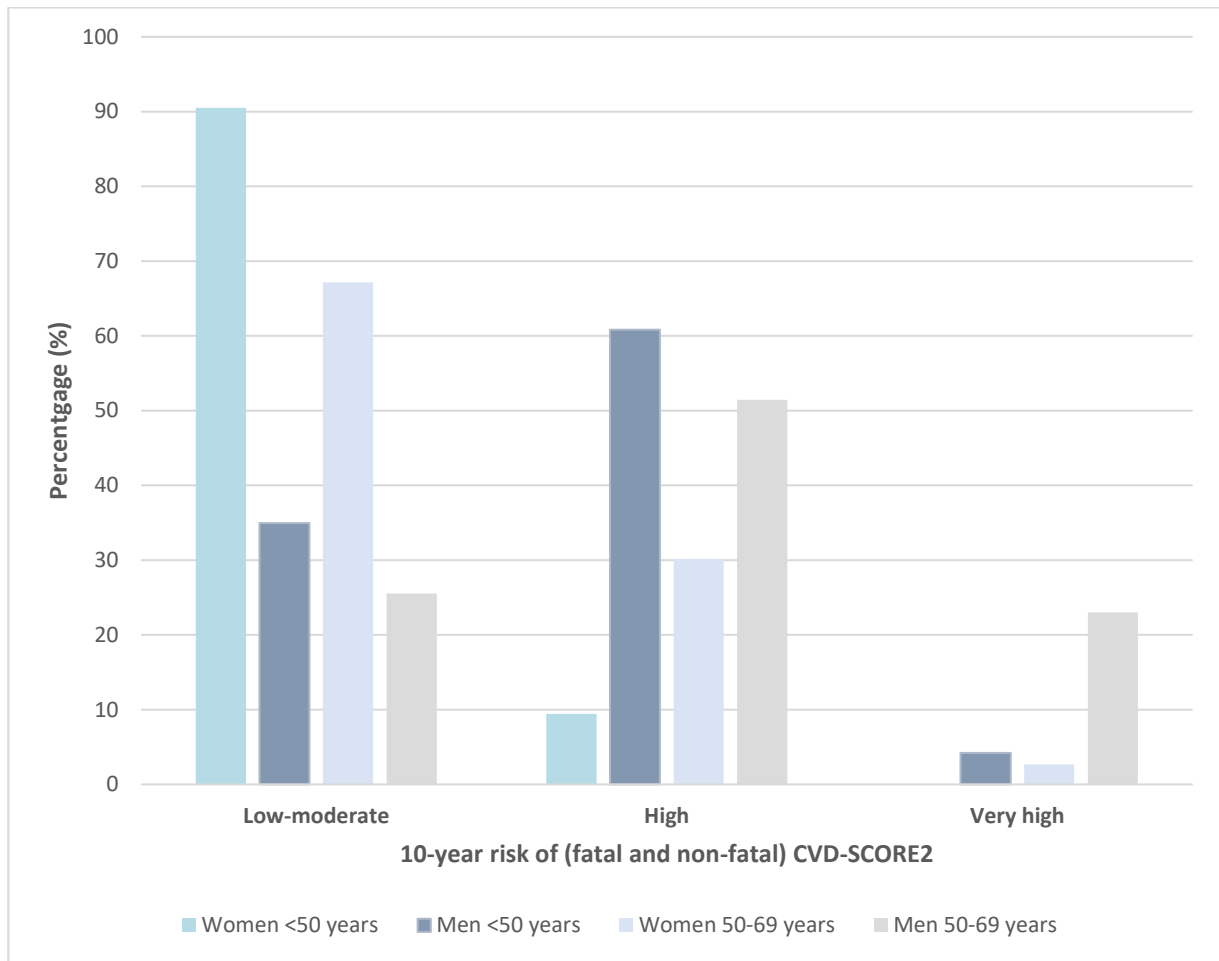

(B)

*Analysis based on the entire population at baseline. BP, blood pressure; MI, myocardial infarction
Reference categories in the multinomial logistic regression models for BMI categories (normal weight), smoking status (never) and alcohol consumption (never).

Figure S5. Frequencies of predicted 10-year CVD risk in women and men 40-69 years old from the NAKO study-baseline assessment using the SCORE2 algorithm

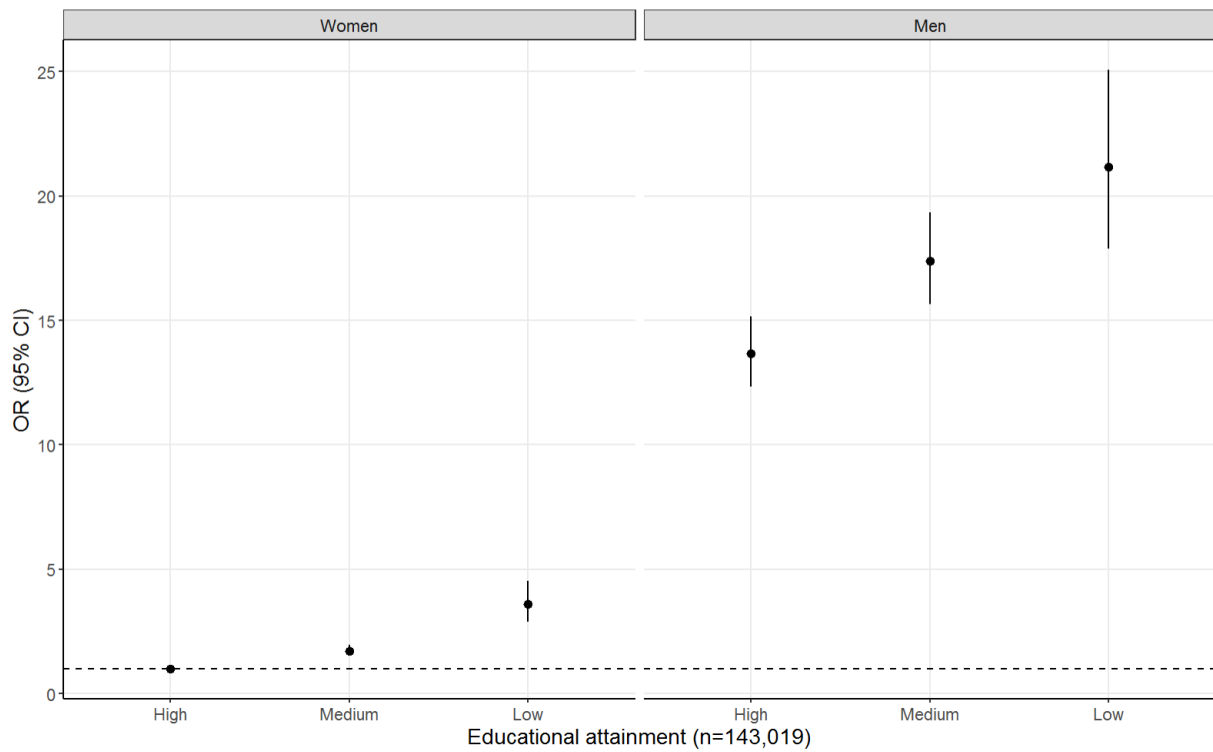

<50 years	Low-moderate risk (<2.5 %)	High-risk (2.5 to <7.5%)	Very high-risk (≥7.5%)
Number of women, n*	22,912	2,392	17
Number of men, n*	8,852	15,375	1,068
50-69 years	Low-moderate risk (<5 %)	High-risk 5 to (<10%)	Very high-risk (≥10%)
Number of women, n*	32,618	14,661	1,302
Number of men, n*	11,191	22,552	10,079

* Numbers correspond to the average estimates across all the imputations.

Figure S6. Odds ratio (95% confidence intervals) for the association between proxies of SES (A) educational attainment, (B) relative income) and very high-risk SCORE2 for predicted 10-year risk of CVD in the NAKO study* (reference category highly educated women).

A.

B.

* Analysis based on the population 40-69 years.
